SOURCES FOR MISSOURI WHEAT VARIETIES.....	39

Our motto is “We test the best” and that is exactly what we do. Each year, the best seed companies and organizations select several of their best varieties for evaluation by the MU Variety Testing Program. We use the latest scientific principles and procedures to provide farmers and others with an interest in wheat variety performance with accurate and unbiased information.

We respect the seed companies and organizations that put their varieties to the test. We are honored that they entrust us with their valuable products. It takes courage to allow their varieties to be compared with all of the others. Not every company participates in our program for various reasons. Those companies that do participate deserve your consideration when purchasing seed for the next growing season. Please view the table at the back of our book for names and addresses of participating seed companies. Thank them for their courage and tell them you saw their variety in our program.

The MU Variety Testing Program has provided Missouri farmers with unbiased variety comparisons for more than 75 years, first with corn, then soybean and wheat. Current staff members have a total of over 100 years of experience with testing crop yield performance. Our plots are placed where you farm. They have the soils and weather conditions your fields have. The MU Variety Testing Program is on-farm research in the truest sense of the word. Six of our wheat locations are on farmer fields in your communities. The other three locations are MU farms. These CAFNR owned and operated research centers sample the north and southeast regions of Missouri and combined with the private farm locations provide you with the diversity of environments you need to select the best varieties for your farm. View the map in our procedures section to see the placement of our locations and the cooperators that are so important to the quality of our information.

Evaluating yield and making decisions based on that evaluation are difficult because yield is highly affected by environment – even the small differences that exist across a field. We use replication, plot size, and plot placement to minimize the “noise”. Please read the procedures section of this book to better understand what we do and the tools we provide you to make variety selection decisions. Our data tables are arranged to help you quickly see how varieties compare. We strongly suggest that you use information from more than one location. Our tables of “region means” provide you comparisons across multiple locations. If varieties are entered by companies in more than one year we provide you with 2-year means increasing the number of environments for your observation. Finally, although yield is extremely important please see our variety characteristics table located near the back of the book to view additional information that you might find helpful during variety selection.

Thank you for your interest and support. Please support the companies that participate in our program. If you have any suggestion on how we can improve our program please contact me directly (wieboldw@missouri.edu; 573-882-2307). The MU Variety Testing Program exists to serve your needs. We want to provide you with the best information possible.

William “Bill” Wiebold

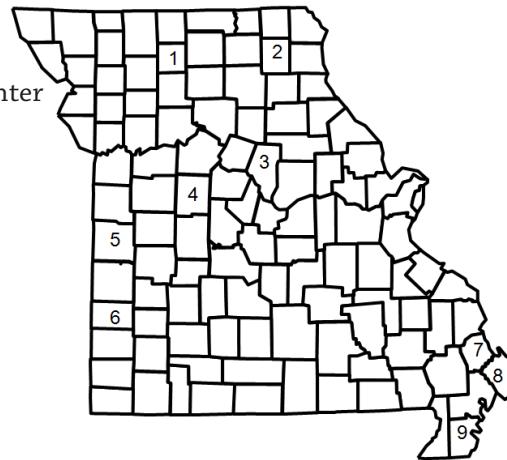

PROCEDURES

Regions and Locations

The MU Variety Testing program divides the wheat growing area of Missouri into three regions: North, Southwest, and Southeast. Each region contains three locations, and the same varieties are tested in all locations within a region. Locations for 2015 are as follows:

North

1. Trenton (Grundy County); Peter Brewer farm
2. Novelty (Knox County); Greenley Memorial Research Center
3. Columbia (Boone County); Bradford Research Center

Southwest

4. Hughesville (Pettis County); Kenny Tevis farm
5. Adrian (Bates County); Darrel Tenholder farm
6. Lamar (Barton County); David Sheat farm

Southeast

7. Oran (Scott County); Glenn Nothdurft farm
8. Charleston (Mississippi County); Don Deline farm
9. Portageville (Pemiscot County); Delta Research Center

Entries

All seed companies were eligible to enter varieties in the 2015 wheat test. Participation was voluntary and the MU Variety Testing Program exercised no control over which or how many varieties were entered. The MU Variety Testing Program receives no Missouri tax dollars, so a fee was collected for each entry to fund the program.

Field Plot Design and Plot Management

Varieties were randomly arranged in the field according to a lattice design with three replications. Plots were six rows wide and 25 feet long. Row spacing was 7.5 inches. Planting rate was 1,500,000 seeds/acre. All six rows were harvested with a combine designed for small-plot work.

Fertilizer was applied at each location at the discretion of the farmer or research station manager. Herbicides were used to control weeds, and fungicides were applied as needed to prevent disease incidence. Management details varied among locations and are specified in individual region crop management summaries.

Data Recorded

Plant height was measured at maturity. Lodging was rated immediately before harvest using a scale of 1 to 5 where 1 = all plants erect, 3 = all plants leaning moderately or 20 to 50% lodged, 5 = all plants lodged. During harvest, plot grain weights and test weights were measured and an electronic moisture tester was used to determine the moisture content of the grain. Yields were corrected to a moisture content of 13% and expressed as bushels/acre.

Comparing Varieties

The performance of a variety cannot be measured with absolute precision. Uncontrolled variability is involved in the determination of each plot's yield. This variability exists in all field experiments and in farmer fields. Statistics are used to account for this variability and to assist farmers in selecting superior varieties. The statistical tool used by the MU Variety Testing Program is called "least

significant difference" (LSD). The LSD is simple to use. When two varieties are compared and the difference between them is greater than the LSD, the varieties are considered to be significantly different. Differences between two varieties smaller than the LSD may have occurred by chance and are considered to be not significant. The LSD can be found at the bottom of each table.

The MU Variety Testing Program arranges varieties within each table from highest yield to lowest yield. The "top yielding" variety in each table has been identified by a double asterisk (**). Varieties that did not yield significantly less than the highest yielding variety in the table are denoted by a single asterisk (*). Thus, by reading down the yield column, readers can readily identify the highest yielding varieties in a location.

Variety performance may seem inconsistent from location to location and from year to year. These differences are caused by differences among environments for rainfall, temperatures, soil fertility, diseases, insects, and many other factors. To obtain an improved estimate of relative variety performance, readers should consider results from more than one environment (locations and/or years). The vast majority of varieties are entered into our tests for only one year, so comparing varieties across multiple locations becomes even more important. The MU Variety Testing Program facilitates variety comparisons across locations by publishing Region Means. Region Means tables contain yield data from all individual locations in the region and yields averaged across all of the locations. The variety with the highest average yield and varieties that do not differ for yield from that variety are designated with double (**) and single (*) asterisks.

Although yield usually receives first consideration, other agronomic characteristics may be equally important when selecting a wheat variety. The MU Variety Testing Program measures test weight and plant height and rates plant lodging. These data are presented in each location table. Winter hardiness, maturity, resistance to Hessian fly, and resistance to several diseases are among the variety characteristics that deserve careful consideration. We provide a table that contains several important characteristics of varieties entered into the MU Variety Testing Program. This information was provided by seed companies. Please contact seed company representatives for the latest information. Seed entered into the MU Variety Testing Program is usually treated with one or more seed treatments. These seed treatments are identified in the table listing the variety characteristics.

Accessibility of Data

Results of the 2015 crop performance tests are available in print format and online at "varietytesting.missouri.edu". If you need assistance in accessing the web site or would like to receive a printed copy please call 573-882-2307.

Authors

William J. Wiebold is a Professor of Plant Sciences and State Extension Specialist; Howard Mason, Delbert Knerr, David Schwab, William Schelp, and Ben Caldwell.

Acknowledgments

The MU Variety Testing Program recognizes and expresses appreciation to the following individuals for their part in making the 2015 wheat performance tests possible: Peter Brewer, Trenton; Dana Harder, superintendent, Greenley Memorial Research Center, Novelty; Tim Reinbott, superintendent, Bradford Research and Extension Center, Columbia; Kenny Tevis, Hughesville; Darrel Tenholder, Adrian; David Sheat, Lamar; Glenn Nothdurft, Oran; Don Deline, Charleston; Trent Hagard, superintendent, Delta Research Center, Portageville.

NORTH REGION

CROP MANAGEMENT SUMMARY

The Wheat Test was conducted at three locations in the North Region (Columbia, Novelty, Trenton). All locations were planted in October and winter survival was good. May and June precipitation amounts were well above average, which contributed to increased disease incidence.

Characteristics of Wheat Test Locations – North Region

Location	Soil Type	pH	Soil Test			Precipitation ^a				
			%	OM pounds/acre	P pounds/acre	K pounds/acre	Fall	Winter	Apr	May
Columbia	Mexico silt loam	5.1	2.6	25	231	12.8	4.4	3.9	4.9	26.0
Novelty	Putnam silt loam	6.4	3.3	40	276	6.7	2.9	1.8	4.2	15.6
Trenton	Lagonda silty clay loam	6.5	2.7	99	360	5.4	3.0	2.4	7.0	17.8

^a Fall is October through December; Winter is January through March

^b Region average growing season (October through May) total = 19.8 inches, 2.3 inches below normal

SOUTHWEST REGION

CROP MANAGEMENT SUMMARY

The Wheat Test was to be conducted at three locations in the Southwest Region (Hughesville, Adrian, Lamar). The Adrian location was abandoned because of poor initial stand establishment. A fungicide was applied at Hughesville.

Characteristics of Wheat Test Locations – Southwest Region

Location	Soil Type	pH	Soil Test			Precipitation ^a				Total ^b
			%	pounds/acre		Fall	Winter	Apr	May	
Hughesville	Arispe silt loam	5.9	2.4	128	265	12.6	5.2	4.3	7.1	29.2
Adrian	Kenoma silt loam	7.2	3.0	52	281	12.2	2.8	4.1	9.2	28.3
Lamar	Parsons silt loam	7.1	3.0	78	311	8.6	3.5	3.8	8.5	24.4

^a Fall is October through December; Winter is January through March

^b Region average growing season (October through May) total = 27.3 inches, 3.9 inches above normal
