## PREFACE

Our motto is “We test the best” and that is exactly what we do. Each year, the best seed companies and organizations select several of their best varieties for evaluation by the MU Variety Testing Program. We use the latest scientific principles and procedures to provide farmers and others with an interest in soybean variety performance with accurate and unbiased information.

We respect the seed companies and organizations that put their varieties to the test. We are honored that they entrust us with their valuable products. It takes courage to allow their varieties to be compared with all of the others. Not every company participates in our program for various reasons. Those companies that do participate deserve your consideration when purchasing seed for the next growing season. Please view the table at the back of our book for names and addresses of participating seed companies. Thank them for their courage and tell them you saw their variety in our program.

The MU Variety Testing Program has provided Missouri farmers with unbiased variety comparisons for more than 75 years, first with corn, then soybean and wheat. Current staff members have a total of over 80 years of experience with testing crop yield performance. Our plots are placed where you farm. They have the soils and weather conditions your fields have. The MU Variety Testing Program is on-farm research in the truest sense of the word. Fifteen of our locations are on farmer fields in your communities. The other four locations are MU farms. These CAFNR owned and operated research centers sample the north, central and southeast regions of Missouri and combined with the private farm locations provide you with the diversity of environments you need to select the best varieties for your farm. View the map in our procedures section to see the placement of our locations and the cooperators that are so important to the quality of our information.

Evaluating yield and making decisions based on that evaluation are difficult because yield is highly affected by environment — even the small differences that exist across a field. We use replication, plot size, and plot placement to minimize the “noise.” Please read the procedures section of this book to better understand what we do and the tools we provide you to make variety selection decisions. Our data tables are arranged to help you quickly see how varieties compare. We strongly suggest that you use information from more than one location. Our tables of “region means” provide you comparisons across multiple locations. Although yield is extremely important, please see our variety characteristics table located near the back of the book to view additional information that you might find helpful during variety selection.

Thank you for your interest and support. Please support the companies that participate in our program. If you have suggestions on how we can improve our program, please contact me directly ([wieboldw@missouri.edu](mailto:wieboldw@missouri.edu)). The MU Variety Testing Program exists to serve your needs. We want to provide you with the best information possible.

William “Bill” Wiebold

# PROCEDURES

## Regions and locations

The MU Variety Testing Program divides the soybean growing region of Missouri into four regions: North, Central, Southeast, and Southwest. North, Central, and Southeast regions contain five locations, while the Southwest contains four. The same varieties are tested in all locations within a region. Locations for 2017 are as follows:

1. **Craig** (Holt County); Steve Cunningham Farm
2. **Albany** (Gentry County); Hundley-Whaley Research Center
3. **Mooreville** (Livingston County); Beetsma Farms
4. **Novelty** (Knox County); Greenley Research Center
5. **Canton** (Lewis County); Lloyd & McCutchan Farm
6. **Henrietta** (Ray County); John Williams Farm
7. **Grand Pass** (Saline County); Ryland and Fred Utlaut Farm
8. **Columbia** (Boone County); Bradford Research Center
9. **Truxton** (Montgomery County); Roy Cope Farm
10. **Annada** (Pike County); Bob Burkemper Farm
11. **Garden City** (Cass County); Bill Cook Farm
12. **Adrian** (Bates County); Tenholder Farms
13. **Urich** (Henry County); Kurt Gretzinger Farm
14. **Lamar** (Barton County); Wally Norton Farm
15. **Chaffee** (Scott County); Martin Eftink Farm
16. **Charleston** (Mississippi County); Don Deline Farm
17. **Morehouse** (New Madrid County); Tom Jennings Farm  
and **New Madrid** (New Madrid County) Peter Rost Farm
18. **Portageville** (Pemiscot County); Fisher Delta Research Center

## Entries

All seed companies and organizations were eligible to enter the 2017 soybean test. Participation was voluntary and the MU Variety Testing Program exercised no control over which or how many varieties were entered. The MU Variety Testing Program receives no Missouri tax dollars, so a fee was collected for each entry to fund the program.

All soybean varieties, regardless of herbicide trait, were entered into a single test. Varieties were separated by Maturity Group e.g. MG 3, MG 4, and MG 5. Maturity Group information was provided by seed companies.

## Field plot design and plot management

Varieties were randomly arranged in the field according to a lattice design with three replications. Row spacing for all locations was 30 inches and seeding rate was 160,000 seeds/acre. Plots were two rows wide (5 feet) and 27 feet long. All rows of each plot were harvested to determine yield. Plots were planted and harvested with commercial equipment modified for small plot work. Fertilizer was applied at each location at the discretion of the farmer or the station manager. Weed control was achieved with pre-plant herbicides and various conventional post-emergence herbicides. Additional hand weeding was done as required. Management details varied among locations and are specified in the regional crop management summaries.

## Data recorded

Lodging and height were determined immediately before harvest. A scale of 1 to 5 was used to score lodging where 1 = less than 20% plants lodged, 3 = all plants leaning moderately or 40%–60% plants down, 5 = more than 80% plants down. During harvest, plot grain weights were measured and an

electronic moisture tester was used to determine the moisture content of the grain. Yields were corrected to a moisture content of 13% and expressed as bushels/acre. The MU Variety Testing program attempted to locate sites in fields of low to moderate levels of SCN.

### **Comparing varieties**

The performance of a variety cannot be measured with absolute precision. Uncontrolled variability is involved in the determination of each plot's yield. This variability exists in all field experiments and in farmer fields. Statistics are used to account for this variability and to assist farmers in selecting superior varieties. The statistical tool used by the MU Variety Testing Program is called "least significant difference" (LSD). The LSD is simple to use. When two varieties are compared and the difference between them is greater than the LSD, the entries are considered to be significantly different. Differences between two varieties that are smaller than the LSD may have occurred by chance and are considered to be not significant. In other words, the two varieties might have the same yield, grain moisture or other characteristics of interest. The LSD can be found at the bottom of each table.

The MU Variety Testing Program arranges varieties within each table from highest yield to lowest yield. The "top yielding" variety in each test is identified by a double asterisk (\*\*) placed next to its yield. Varieties that did not yield significantly less than the highest yielding variety in the test are denoted in the tables by a single asterisk (\*). Thus, by reading down the yield column, readers can readily identify the highest yielding varieties in a test.

Variety performance may seem inconsistent from location to location and from year to year. These differences are caused by differences among environments for rainfall, temperatures, soil fertility, diseases, insects, and many other factors. To obtain an improved estimate of relative variety performance, readers should consider results from more than one environment (locations and/or years). The vast majority of varieties are entered into our tests for only one year, so comparing varieties across multiple locations becomes even more important. The MU Variety Testing Program facilitates variety comparisons across locations by publishing Region Means. Region Means tables contain yield data from all individual locations in the region with yields averaged across the locations. The variety with the highest average yield and varieties that do not differ for yield from that variety are designated with double (\*\*) and single (\*) asterisks.

Although yield usually receives first consideration, other agronomic characteristics may be equally important when selecting a soybean variety. Standability, maturity, herbicide tolerance and disease resistance are among the characteristics that deserve careful consideration. We provide a table that contains several important characteristics of varieties entered into the MU Variety Testing Program. This information was provided by seed companies. Please contact seed company representatives for the latest information. Seed entered into the MU Variety Testing Program is usually treated with one or more seed treatments. These seed treatments are identified in the table listing the variety characteristics.

### **Accessibility of data**

Results of the 2017 crop performance tests are available online at [varietytesting.missouri.edu](http://varietytesting.missouri.edu). If you need help accessing the website or would like to receive a printed copy, please call 573-882-2307.

Novelty	June 1	Oct 30	13	65	115	Min.	Dual II Magnum, Sonic	Reflex, Select Max, Basagran

#### Notes:

Exposure to the herbicide dicamba was reported in soybean fields in many areas of Missouri. Not all of the varieties entered into the MU Variety Testing Program are resistant to dicamba. We visited all of our locations and rated the plants for foliar symptoms. In addition, we carefully studied variety rankings across locations within a region. Locations in the North Region exhibited light to no foliar symptoms. Variety rankings across the five locations were consistent with no yield effects from dicamba.

## CENTRAL REGION — CROP MANAGEMENT SUMMARY

### Characteristics of Soybean Test Locations — Central Region

Location	Soil type	Soil test				Precipitation					
		pH	OM	P	K	May	June	July	Aug.	Sept.	Season
Annada	Tice silt loam	5.6	2.3	76	234	5.9"	4.2"	2.5"	2.1"	1.0"	15.7"
Columbia	Mexico silt loam	5.9	2.6	23	191	4.5"	3.2"	4.6"	3.0"	0.8"	16.1"
Grand Pass	Haynie silt loam	5.1	2.2	23	356	4.4"	8.5"	2.8"	4.5"	0.6"	20.8"
Henrietta	Haynie silt loam	6.2	1.6	66	325	4.3"	6.2"	6.0"	7.1"	0.9"	24.5"
Truxton	Mexico silt loam	6.7	2.8	116	275	6.3"	2.9"	7.1"	3.9"	1.1"	21.3"

### Crop Management Practices at Soybean Test Locations — Central Region

Location	Dates		Fertilizer				Herbicides	
	Planting	Harvest	N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O	Tillage	Pre	Post
Annada	June 6	Oct. 24	0	0	60	Conv.	Dual II Magnum, Sonic, Liberty	Reflex, Select Max
Columbia	May 31	Oct. 27	0	0	0	Conv.	Dual II Magnum, Sonic, Liberty	Ultra Blazer, Select Max, Basagran
Grand Pass	May 31	Nov. 3	0	0	0	Conv.	Dual II Magnum, Sonic, Liberty	Reflex, Select Max, Basagran
Henrietta	June 2	Nov. 7	0	0	0	Conv.	Dual II Magnum, Sonic, Roundup	None
Truxton	May 30	Oct. 18	0	0	0	Min.	Dual II Magnum, Sonic, Liberty	Reflex, Select Max, Basagran

#### Notes:

Exposure to the herbicide dicamba was reported in soybean fields in many areas of Missouri. Not all of the varieties entered into the MU Variety Testing Program are resistant to dicamba. We visited all of our locations and rated the plants for foliar symptoms. In addition, we carefully studied variety rankings across locations within a region. All but one location in the Central Region exhibited light to no foliar symptoms. At one location, Grand Pass, foliar damage was isolated to a single replication. We removed the yield data from that replication and again checked variety rankings. After removal of the one rep at one location, variety rankings across the five locations were consistent with no yield effects from dicamba.

## SOUTHWEST REGION — CROP MANAGEMENT SUMMARY

### Characteristics of Soybean Test Locations — Southwest Region

Location	Soil type	Soil test				Precipitation					
		pH	OM	P	K	May	June	July	Aug.	Sept.	Season
Adrian	Kenoma silt loam	6.5	2.5	187	329	5.5"	5.4"	11.1"	9.0"	2.0"	33.0"
Garden City	Haig silt loam	5.8	2.6	19	198	4.8"	5.4"	8.2"	12.7"	3.2"	34.3"
Lamar	Parsons silt loam	5.9	2.2	57	185	8.5"	4.7"	3.8"	11.3"	3.2"	31.5"
Urich	Hartwell silt loam	5.2	2.6	15	169	6.1"	4.9"	7.9"	9.6"	2.0"	30.5"

### Crop Management Practices at Soybean Test Locations — Southwest Region

Location	Dates		Fertilizer				Herbicides	
	Planting	Harvest	N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O	Tillage	Pre	Post
Adrian	June 8	Nov. 20	0	0	0	No-till	Authority XL	Ultra Blazer, Select
Garden City	June 9	Nov. 13	0	0	0	Conv.	Dual II Magnum, Sonic	Ultra Blazer, Select Max
Lamar	June 7	Nov. 17	0	0	0	Min.	Dual II Magnum, Sonic	Ultra Blazer, Select Max
Urich	June 13	Nov. 10	0	0	0	Conv.	Dual II Magnum, Sonic, Metribuzin	None

#### Notes:

Exposure to the herbicide dicamba was reported in soybean fields in many areas of Missouri. Not all of the varieties entered into the MU Variety Testing Program are resistant to dicamba. We visited all of our locations and rated the plants for foliar symptoms. In addition, we carefully studied variety rankings across locations within a region. Locations in the Southwest Region exhibited light to no foliar symptoms. Variety rankings across the five locations were consistent with no yield effects from dicamba.

## SOUTHEAST REGION — CROP MANAGEMENT SUMMARY

### Characteristics of Soybean Test Locations — Southeast Region

Location	Soil type	Soil test				Precipitation						
		pH	OM	P	K	May	June	July	Aug.	Sept.	Season	Irrigate
Chaffee	Commerce silt loam	6.3	2.1	80	235	5.9"	5.5"	3.6"	2.4"	0.5"	17.9"	0"
Charleston	Dundee silt loam	7.1	2.9	86	326						Abandoned	
Morehouse	Sharkey clay	6.0	2.6	38	270	7.4"	2.1"	4.6"	2.7"	0.5"	17.3"	4.0"
New Madrid	Bosket sandy loam	6.0	2.5	47	273	4.5"	3.8"	2.6"	4.1"	0.4"	15.4"	4.0"
Portageville	Tiptonville silt loam	6.7	1.7	77	302	5.5"	4.3"	3.7"	5.1"	0.4"	19.0"	3.0"

### Crop Management Practices at Soybean Test Locations — Southeast Region

Location	Dates		Fertilizer			Tillage	Herbicides	
	Planting	Harvest	N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O		Pre	Post
Chaffee	June 8	Nov. 20	0	0	0	Conv.	Prowl, Metribuzin	Cobra, Select Max
Charleston	June 13		Abandoned			Conv.	Dual II Magnum, Sonic, Liberty	Cobra, Select Max
Morehouse	June 9	Nov. 14	0	0	0	Conv.	Dual II Magnum, Sonic, Roundup	Ultra Blazer, Select Max
New Madrid	June 10	Nov. 27	0	0	0	Conv.	Dual II Magnum, Sonic, Roundup	Ultra Blazer, Select Max
Portageville	June 12	Nov. 27	0	0	0	Conv.	Dual II Magnum, Sonic, Roundup, Liberty	Ultra Blazer, Select Max

#### Notes:

Exposure to the herbicide dicamba was reported in soybean fields in many areas of Missouri. Not all of the varieties entered into the MU Variety Testing Program are resistant to dicamba. We visited all of our locations and rated the plants for foliar symptoms. In addition, we carefully studied variety rankings across locations within a region. Two locations in the Southeast Region, Chaffee and New Madrid, exhibited light to no foliar symptoms. Variety rankings across the two locations were consistent with no yield effects from dicamba.

At one location, Portageville, foliar symptoms were moderate. We compared variety rankings of Portageville with those of Chaffee and New Madrid. We detected no effect from the exposure to dicamba on variety rankings for yield. We posted the Portageville data and two sets of Region Means information. In the first column of region means we used only Chaffee and New Madrid locations. In the second column of Region Means, we presented means across all three locations including Portageville.

We could not use the yield data from Charleston and Morehouse.

<sup>1</sup> MG = maturity group; first digit is maturity group; second digit is relative maturity within the group.

<sup>2</sup> Seed treatments listed in table were applied by seed companies to seed entered into MU Variety Testing Program. Purchased seed may contain other seed treatments. See seed company representatives and seed labels for more information.

<sup>3</sup> Source of resistant to soybean cyst nematode. Peking = PI548402; Hartwig = PI437654. “n/i” means the company did not provide information.

<sup>4</sup> Several traits confer herbicide tolerance to soybean varieties. “Y” in the “GLY” column means the variety possesses a glyphosate resistance trait (biotech). “Y” in the “GLU” column means the variety possesses a glufosinate resistance trait (biotech). “Y” in the “DIC” column means the variety possesses a dicamba resistance trait (biotech). See seed company representatives for more information and check seed bag for registered trademarks of specific traits of interest.
