## **Missouri 2008 Corn Performance Tests**

This report is a contribution of the Division of Plant Sciences, University of Missouri College of Agriculture, Food and Natural Resources. The work was supported by fees provided by companies submitting hybrids for evaluation. The University of Missouri's hybrid performance testing program began in the mid-1930s, with results first published in 1937. The number of entries in the program has grown from fewer than 50 in the early years to 243 today. The large number of commercial hybrids available makes selection of a superior hybrid difficult. To select intelligently, producers need a reliable, unbiased, up-to-date source of information that will permit valid comparisons among available hybrids. The objective of the University of Missouri's Performance testing program is to provide this information. The tests are conducted under the most uniform conditions possible. Small plots are used to reduce the chance of soil and climatic variations occurring between one hybrid plot and another. Results obtained should aid the individual grower in judging the relative merits of many of the commercial corn hybrids available in Missouri today.

### **Comparing Hybrids**

The performance of a hybrid cannot be measured with absolute precision. Uncontrolled variability is involved in the determination of each yield average. This variability exists in all field experimentation; statistics are used as a tool to assist in making decisions. The statistical tool used in these tests is the test of least significant difference (LSD). The LSD is simple to apply. When two entries are compared and the difference between them is greater than the LSD, the entries are considered to be significantly different. Differences smaller than the LSD may have occurred by chance and are considered non-significant.

Hybrid performance may seem inconsistent from location to location and from year to year. The factors for these differences are rainfall, temperatures, soil fertility, diseases, insects, and other factors. To obtain an improved estimate of relative hybrid performance, readers should consider results from more than one location or year. In this publication, the authors have tried to facilitate comparisons across years and locations. In each test, the "top yielding" hybrids have been identified. These hybrids are those that did not yield significantly less than the highest yielding hybrid in the test. They are denoted in the tables by an asterisk (\*) next to their yields. Thus, by going down a column, readers can readily identify the highest yielding hybrids in a test. By following a row across the table, readers can evaluate the relative performance of a hybrid during several years or at several locations. From the standpoint of yield, the most desirable hybrids will be those that are among the "top yielding" hybrids the greatest number of times.

Although yield usually receives first consideration, other agronomic characteristics may be equally important when selecting a corn hybrid. Stalk strength, maturity and resistance to insects and diseases are among the hybrid characteristics that deserve careful consideration. Later maturing hybrids may require more drying. The maturity classification listed for each hybrid in this bulletin is based solely on information supplied by the entry's sponsor. A hybrid with abnormally low or high moisture content may be incorrectly classified for Missouri conditions. Poor stalk strength and susceptibility to pests may decrease harvestable yield because of lodging or stand loss.

The Missouri Variety Testing Program does not make specific recommendations for hybrids. Farmers growing a new hybrid for the first time should consider all the information available and then grow a small acreage to determine adaptability. This should be the practice for all new hybrids regardless of origin.

### **The Authors**

William J. Wiebold is a Professor of Plant Sciences and State Extension Specialist; Howard L. Mason and Travis Belt are Research Associates; Delbert Knerr, Richard W. Hasty, David M. Schwab, and Jeremy Angotti are Research Specialists and Bruce Burdick is the Superintendent of the Hundley-Whaley Research Center.

The authors recognize and express their appreciation to the following individuals for their part in making the 2008 corn performance tests possible: Steve Cunningham, Craig; Bruce Burdick, Superintendent, Hundley-Whaley Research Center, Albany; Ron and Bud Beetsma, Mooresville, Randall Smoot, Superintendent, Greenley Memorial Center, Novelty; Roger Tiemann, LaGrange; John Williams, Henrietta; Frank Swisher, Marshall; Tim Reinbott, Superintendent, Bradford Research & Extension Center, Columbia; Kevin Freyer, Laddonia; Roy Cope, Truxton; Bob Burkemper, Annada; Doug Roth, Harrisonville; Ron Bean, Lamar; Kurt Gretzinger, Urich; Glenn Nothdurft, Oran; Dale and Charlie Glenn, Charleston; Jake Fisher, Superintendent, Delta Research Center, Portageville.

## Experimental Procedures

### Test Descriptions:

Non-Irrigated Corn Test: This test consists of five locations each in the north and central regions of the state and three locations in the southwest. Corn hybrids not approved for export to Japan cannot be entered in this test, but should be entered into the New Technology Corn Test (see description below).

Irrigated Corn Test: This test will have two locations each in the central and southwest regions and three locations in the southeast region of the state. Corn hybrids not approved for export to Japan cannot be entered in this test, but should be entered into the New Technology Corn Test (see description below).

New Technology Corn Test: This test will evaluate hybrids not approved for export to Japan (e.g Syngenta Agrisure hybrids). Information on current approval status of biotech events is available on the National Corn Growers Association website: [ncka.com](http://ncka.com) and click “Know Before You Grow.” Locations for this test include three non-irrigated locations in North and Central Missouri and three irrigated locations in Southeast Missouri. Entries will be compared to three high-yield standard hybrids. Grain from this test will be marketed into approved channels.

Entries: All producers of hybrid seed were eligible to enter the 2008 corn evaluation tests. Participation was voluntary and the test coordinators exercised no control over which, or how many hybrids were entered. To help finance the evaluation program, the participants paid \$100 per location for each hybrid entered.

Plot Management: All tests were planted and harvested with commercial equipment modified for small plot work. Row spacing for all corn tests was 30 inches. Seeding rate for non-irrigated corn tests was 28,600 seeds/acre and irrigated corn tests was 34,200 seeds/acre. Preplant fertilizer was applied at each site at the discretion of the farmer or the station manager. Herbicides were used to control weeds, and additional hand weeding was done as required. Management details varied from location to location and are specified in the regional crop management summaries.

Data Recorded: --- Plant stands were recorded mid-season and lodging was determined immediately before harvest. Plants leaning more than 30 degrees from vertical and those bent or broken below the ear were counted as lodged. During harvest, plot grain weights were measured and an electronic moisture tester was used to determine the moisture content of the grain. Yields were calculated from the data collected and reported in bushels (56 pounds) per acre at a moisture content of 15.5 percent.

Accessibility of Data: The results of the 2008 crop performance tests are also available online at:

[varietytesting.missouri.edu](http://varietytesting.missouri.edu). If you need assistance in accessing the system: call 573-882-4827 for the staff's help.

Field Plot Design: Full season hybrids were evaluated in non-irrigated and irrigated tests. Tests were arranged in lattice or randomized complete block field plot designs depending on the number of entries in each test. At all locations, plots were four rows wide and 25 feet long with a between-the-row spacing of 30 inches. Only the center two rows were harvested to determine yield.

**Locations:** On the basis of geographical characteristics, the state was divided into regions. Corn hybrid evaluation tests were located in the northern, central, southwestern and southeastern regions of the state. Test locations are shown on the adjacent map. In 2008, the locations for these tests were:

1. Steve Cunningham Farm near Craig in Holt Co.;
2. Hundley-Whaley Farm near Albany in Gentry Co.;
3. Beetsma Farm near Mooresville in Livingston Co.;
4. Greenley Memorial Center near Novelty in Knox Co.;
5. Roger Tiemann Farm near LaGrange in Lewis Co.;
6. John Williams Farm near Henrietta in Ray Co.;
7. Frank Swisher Farm near Marshall in Saline Co.;
8. Bradford Research & Extension Center near Columbia in Boone Co.;
9. Kevin Freyer Farm near Laddonia in Audrain Co.;
10. Roy Cope Farm near Truxton in Montgomery Co.;
11. Bob Burkemper Farm near Annada in Pike Co.;
12. Doug Roth Farm near Harrisonville in Cass Co.;
13. Ron Bean Farm near Lamar in Barton Co.;
14. Kurt Gretzinger Farm near Urich in Henry Co.;
15. Glenn Nothdurft Farm near Oran in Scott Co.;
16. H.S. Byrd Farm, near Charleston in Mississippi Co.;
17. Delta Research Center near Portageville in Pemiscot Co.

Results are presented by region within the state. For each location, data on seed treatment, final plant stand, lodging, moisture at harvest, and yield adjusted for moisture is given for each hybrid. Growing season (May-September) rainfall and irrigation applied at each location are shown on individual data tables. In this report, hybrids are ranked according to yield.

## North Region Crop Management Summary

There are five locations in the North Region for the Non-Irrigated Corn Test and two locations for the New Technology Corn Test. They are located in counties where a significant number of acres of corn are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary slightly between locations, but tend to reflect those followed by farmers in the area.

Planting was delayed at several of the north Region sites until late May because of heavy spring rains. The LaGrange test was lost to flooding when the levee there was breached in mid-June and flood water covered the experiment for several weeks. There were several storms this summer accompanied by high winds that caused significant lodging at Craig and Novelty. The cooperating farmer at Craig applied Headline to combat corn fungal diseases. European corn borer pressure was moderate to heavy at all north Region sites. In spite of all of these challenges, yields at the four locations that were harvested were good, averaging 185 bushels per acre.

Climatological information for the growing season (May 1 – Sept. 30) for the North Region is summarized below and cultural practices for each site are listed in Table 1.

Average temperature = 69.6 degrees, equal to normal

Average precipitation = 30.2", 21.3" above normal

Growing degree days = 2873 days, 198 days below normal

\*\* Highest yielding hybrid in the test.

\* Yield not significantly less than the highest yielding hybrid in the test.

Note: To view seed treatments for these hybrids refer to the location table or the characteristics chart.

## Central Region Crop Management Summary

There are five locations in the Central Region for the Non-Irrigated Corn Test and two locations for the Irrigated Corn Test. They are located in counties where a significant number of acres of corn are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary slightly between locations, but tend to reflect those followed by farmers in the area.

Rainfall was plentiful for all of central Missouri this year, averaging 64% above normal for the region and yields were good at all sites. The Annada site was planted very late and had not matured sufficiently at press time to harvest. Information from that site will be made available on our web-site ([varietytesting.missouri.edu](http://varietytesting.missouri.edu)) after it is harvested. European corn borer pressure was moderate to heavy across the Central Region this year. Warrior was applied to both Columbia experiments in June because of corn ear worm feeding.

Climatological information for the growing season (May 1 – Sept. 30) for the Central Region is summarized below and cultural practices for each site are listed in Table 11.

Average temperature = 70.0 degrees, 1.1 degrees below normal

Average precipitation = 32.5", 12.7" above normal

Growing degree days = 3018 days, 151 days below normal

Table 7. Central Region Crop Management Summary

Location	Planting date	Harvest date	Fertilizer			Tillage	Herbicide Pre	Post	Insecticide

Note: To view seed treatments for these hybrids refer to the location table or the characteristics chart.

## Southwest Region Crop Management Summary

There are three locations in the Southwest Region for the Non-Irrigated Corn Test and two locations for Irrigated Corn Test. They are located in counties where a significant number of acres of corn are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary slightly between locations, but tend to reflect those followed by farmers in the area.

Abundant to excessive rainfall throughout the growing season in Southwest Missouri helped most of the corn tests perform well. The Urich Non-Irrigated Test was never planted because of continued spring rainfall, the farmer there changed cropping plans for that field. The remaining tests survived the wet year and produced mostly average yields.

Climatological information for the growing season (May 1 – Sept. 30) for the Southwest Region is summarized below and cultural practices for each site are listed in Table 21.

Average temperature = 72.0 degrees, 0.2 degrees below normal

Average precipitation = 35.7 ", 12.7" above normal

Growing degree days = 3312 days, 116 days below normal

## Southeast Region Crop Management Summary

There are three locations in the Southeast Region for the Irrigated Corn Test and the New Technology Corn Test. They are located in counties where a significant number of acres of irrigated corn are grown according to the Missouri Agricultural Statistics Service. Cultural practices vary slightly between locations, but tend to reflect those followed by farmers in the area.

Yields at the three southeast Region sites were about normal this year, even though rainfall and growing degree days were both low when compared to long term averages. European Corn Borer infestation was moderate (averaging 22% of the non-Bt plants sampled), which along with some high winds late in the season, contributed to fairly high lodging (45% average) at all three sites. Asana was applied by the cooperating farmer at the Oran site.

Climatological information for the growing season (May 1 – Sept 30) for the Southeast Region is summarized below and cultural practices for each site are listed in table 27.

Average temperature = 74.1 degrees, equal to normal

Average precipitation = 16.2", 2.9" below normal

Growing degree days = 3434 days, 233 below normal

\* Descriptions for commercial Hybrids were provided by the companies submitting them for evaluation

- Data not provided by the companies

NA Data not available

Seed Treatments: 1= Apron XL (Mefenoxam); 2= Captan; 3= Cruiser (Thiamethoxam); 4= Cruiser Extreme Pak (Thiamethoxam, Mefenoxam, Fludioxonil, Azoxystrobin); 5= Dynasty (Azoxystrobin); 6= Maxim XL (Fludioxonil); 7= Poncho 250 (Clothianidin); 8= Trilex (Trifloxystrobin)

Special Traits: DGE = Dry Grind Ethanol; FG = Food Grade; HAE = High Available Energy; HES = High Extractable Starch; HFC = High Fermentable Corn; HME = High Metabolizable Energy; HO = High Oil; HP = High Protein;

Maturity Days: Relative Maturity

Stalk Rating: 1 = excellent; 5 = average; 9 = poor

Herbicide Resistance: GR = Glyphosate Resistance; LL = Liberty Link Resistance; CL = Clear Field

Insect Resistance: CB = Agrisure CB; HX1 = Herculex 1; HXX = Herculex Xtra; VT3 = YieldGard VT; YGCB = YieldGard Corn Borer; YGPL = YieldGard Plus; YGRW = YieldGard Rootworm
