## PREFACE

2015

Our motto is “We test the best” and that is exactly what we do. Each year, the best seed companies and organizations select several of their best varieties for evaluation by the MU Variety Testing Program. We use the latest scientific principles and procedures to provide farmers and others with an interest in soybean variety performance with accurate and unbiased information.

We respect the seed companies and organizations that put their varieties to the test. We are honored that they entrust us with their valuable products. It takes courage to allow their varieties to be compared with all of the others. Not every company participates in our program for various reasons. Those companies that do participate deserve your consideration when purchasing seed for the next growing season. Please view the table at the back of our book for names and addresses of participating seed companies. Thank them for their courage and tell them you saw their variety in our program.

The MU Variety Testing Program has provided Missouri farmers with unbiased variety comparisons for more than 75 years, first with corn, then soybean, wheat and grain sorghum. Current staff members have a total of over 100 years of experience with testing crop yield performance. Our plots are placed where you farm. They have the soils and weather conditions your fields have. The MU Variety Testing Program is on-farm research in the truest sense of the word. Fifteen of our locations are on farmer fields in your communities. The other four locations are MU farms. These CAFNR owned and operated research centers sample the north, central and southeast regions of Missouri and combined with the private farm locations provide you with the diversity of environments you need to select the best varieties for your farm. View the map in our procedures section to see the placement of our locations and the cooperators that are so important to the quality of our information.

Evaluating yield and making decisions based on that evaluation are difficult because yield is highly affected by environment – even the small differences that exist across a field. We use replication, plot size, and plot placement to minimize the “noise”. Please read the procedures section of this book to better understand what we do and the tools we provide you to make variety selection decisions. Our data tables are arranged to help you quickly see how varieties compare. We strongly suggest that you use information from more than one location. Our tables of “region means” provide you comparisons across multiple locations. Although yield is extremely important please see our variety characteristics table located near the back of the book to view additional information that you might find helpful during variety selection.

Thank you for your interest and support. Please support the companies that participate in our program. If you have suggestions on how we can improve our program please contact me directly ([wieboldw@missouri.edu](mailto:wieboldw@missouri.edu); 573-882-2307). The MU Variety Testing Program exists to serve your needs. We want to provide you with the best information possible.

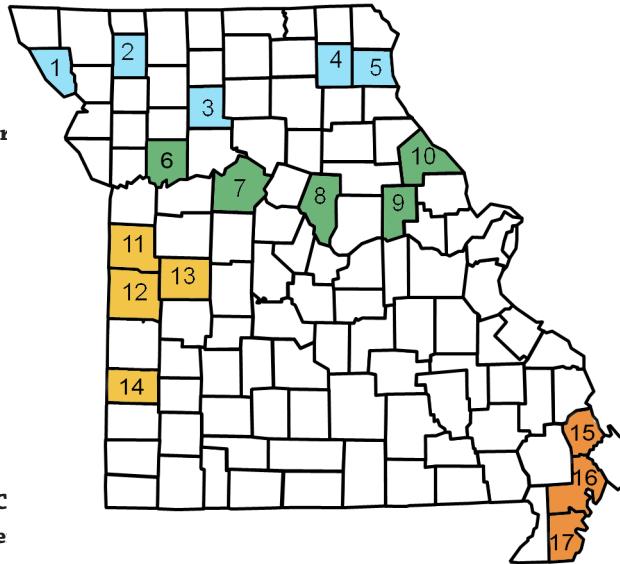

**William “Bill” Wiebold**

# PROCEDURES

## Regions and Locations

The MU Variety Testing Program divides the soybean growing region of Missouri into four regions: North, Central, Southeast, and Southwest. Each region contains five locations, and the same varieties are tested in all locations within a region. Locations for 2015 are as follows:

1. **Craig (Holt County); Steve Cunningham Farm**
2. **Albany (Gentry County); Hundley-Whaley Research Center**
3. **Mooresville (Livingston County.); Beetsma farm**
4. **Novelty (Knox County); Greenley Research Center**
5. **Canton (Lewis County);Lloyd & McCutchan Farm**
6. **Henrietta (Ray County); John Williams Farm**
7. **Grand Pass (Saline County); Ryland and Fred Utlaut Far**
8. **Columbia (Boone County); Bradford Research Center**
9. **Truxton (Montgomery County); Roy Cope Farm**
10. **Annada (Pike County.); Bob Burkemper Farm**
11. **Garden City (Cass County); Bill Cook Farm**
12. **Adrian (Bates County); Darrel Tenholder Farm**
13. **Urich (Henry County); Jeff Nold Farm**
14. **Lamar (Barton County); Wally Norton Farm**
15. **Chaffee (Scott County); Martin Eftink Farm**
16. **Morehouse (New Madrid County); Tom Jennings Farm**
16. **New Madrid (New Madrid County) Peter Rost Farm**
17. **Portageville Loam (Pemiscot County); Delta Research C**
17. **Portageville Clay (Pemiscot County); Delta Research Ce**

## Entries

All seed companies and organizations were eligible to enter the 2015 soybean test. Participation was voluntary and the MU Variety Testing Program exercised no control over which or how many varieties were entered. The MU Variety Testing Program receives no Missouri tax dollars, so a fee was collected for each entry to fund the program.

All soybean varieties, regardless of herbicide trait, were entered into a single test. Varieties were separated by Maturity Group e.g. MG 3, MG 4, and MG 5. Maturity Group information was provided by seed companies.

## Field Plot Design and Plot Management

Lodging and height were determined immediately before harvest. A scale of 1 to 5 was used to score lodging where 1 = less than 20% plants lodged, 3 = all plants leaning moderately or 40% - 60% plants down, 5 = more than 80% plants down. During harvest, plot grain weights were measured and an electronic moisture tester was used to determine the moisture content of the grain. Yields were corrected to a moisture content of 13% and expressed as bushels/acre. The MU Variety Testing program attempted to locate sites in fields of low to moderate levels of SCN.

## Data Recorded

Lodging and height were determined immediately before harvest. A scale of 1 to 5 was used to score lodging where 1 = less than 20% plants lodged, 3 = all plants leaning moderately or 40% - 60% plants down, 5 = more than 80% plants down. During harvest, plot grain weights were measured and an electronic moisture tester was used to determine the moisture content of the grain. Yields were corrected to a moisture content of 13% and expressed as bushels/acre. The MU Variety Testing program attempted to locate sites in fields of low to moderate levels of SCN.

## **Comparing Varieties**

The performance of a variety cannot be measured with absolute precision. Uncontrolled variability is involved in the determination of each plot's yield. This variability exists in all field experiments and in farmer fields. Statistics are used to account for this variability and to assist farmers in selecting superior varieties. The statistical tool used by the MU Variety Testing Program is called "least significant difference" (LSD). The LSD is simple to use. When two varieties are compared and the difference between them is greater than the LSD, the entries are considered to be significantly different. Differences between two varieties that are smaller than the LSD may have occurred by chance and are considered to be not significant. In other words, the two varieties might have the same yield, grain moisture or other characteristics of interest. The LSD can be found at the bottom of each table.

The MU Variety Testing Program arranges varieties within each table from highest yield to lowest yield. The "top yielding" variety in each test is identified by a double asterisk (\*\*) placed next to its yield. Varieties that did not yield significantly less than the highest yielding variety in the test are denoted in the tables by a single asterisk (\*). Thus, by reading down the yield column, readers can readily identify the highest yielding varieties in a test.

Variety performance may seem inconsistent from location to location and from year to year. These differences are caused by differences among environments for rainfall, temperatures, soil fertility, diseases, insects, and many other factors. To obtain an improved estimate of relative variety performance, readers should consider results from more than one environment (locations and/or years). The vast majority of varieties are entered into our tests for only one year, so comparing varieties across multiple locations becomes even more important. The MU Variety Testing Program facilitates variety comparisons across locations by publishing Region Means. Region Means tables contain yield data from all individual locations in the region with yields averaged across the locations. The variety with the highest average yield and varieties that do not differ for yield from that variety are designated with double (\*\*) and single (\*) asterisks.

Although yield usually receives first consideration, other agronomic characteristics may be equally important when selecting a soybean variety. Standability, maturity, herbicide tolerance and disease resistance are among the characteristics that deserve careful consideration. We provide a table that contains several important characteristics of varieties entered into the MU Variety Testing Program. This information was provided by seed companies. Please contact seed company representatives for the latest information. Seed entered into the MU Variety Testing Program is usually treated with one or more seed treatments. These seed treatments are identified in the table listing the variety characteristics.

## **Accessibility of Data**

Results of the 2015 crop performance tests are available in print format and online at "[varietytesting.missouri.edu](http://varietytesting.missouri.edu)". If you need assistance in accessing the web site or would like to receive a printed copy please call 573-882-2307.

## **Authors**

William J. Wiebold is a Professor of Plant Sciences and State Extension Specialist; Howard Mason, Delbert Knerr, David Schwab, William Schelp, and Ben Caldwell.

## NORTH REGION

### CROP MANAGEMENT SUMMARY for 2015

The Soybean Test was conducted at five locations in the North Region (Albany, Canton, Craig, Mooresville, Novelty, ).

#### **Characteristics of the Soybean Test Locations – NORTH REGION**

Location	Soil Type	Soil Test					Precipitation				
		pH	OM	P	K	May	June	July	Aug	Sep	Season <sup>a</sup>
Albany	Grundy silt loam	7.1	2.9%	137	407	5.5"	6.4"	12.8"	3.2	4.0"	31.9"
Canton	Westerville silt loam	6.3	1.8%	113	495	6.0"	8.8"	9.3"	1.2"	1.3"	26.6"
Craig	Blencoe silt clay	6.8	1.8%	79	831	10.2"	6.4"	8.9"	2.8"	5.7"	34.0"
Mooresville	Grundy silt loam	7.0	2.9%	37	382	5.7"	5.1"	8.2"	3.3"	2.0"	24.3"
Novelty	Putnam silt loam	6.3	2.3%	63	382	4.2"	4.7"	9.2"	1.5"	1.2"	20.8"

<sup>a</sup> Region average season precipitation (May through September) = 27.5", 6.4" above normal.

#### **Crop Management Practices at the Soybean Test Locations – NORTH REGION**

Location	Dates		Fertilizer			Tillage	Herbicides		
	Planting	Harvest	N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O		Pre	Post	
Albany	June 29	Oct 29	0	50	60	Min.	Dual II Magnum, Sonic, Roundup PowerMax		none
Canton	May 13	Oct 13	0	0	0	Conv.	Dual II Magnum, Sonic, Roundup PowerMax		none

## CENTRAL REGION

### CROP MANAGEMENT SUMMARY for 2015

The Soybean Test was to be conducted at five locations (Annada, Columbia, Grand Pass, Henrietta, Truxton) in the Central Region. The Annada location was abandoned because heavy and persistent rainfall prevented planting.

#### **Characteristics of the Soybean Test Locations – CENTRAL REGION**

Location	Soil Type	Soil Test					Precipitation				
		pH	OM	P	K	May	June	July	Aug	Sep	Season <sup>a</sup>
Annada	abandoned										
Columbia	Mexico silt loam	6.1	2.3%	50	189	4.8"	6.3"	11.8"	2.8"	0.6"	26.3"
Grand Pass	Haynie silt loam	4.9	1.7%	87	455	8.2"	11.3"	7.9"	1.3"	4.2"	32.9"
Henrietta	Haynie silt loam	6.1	1.5%	90	594	6.8"	11.5"	4.6"	0.9"	2.9"	26.7"
Truxton	Mexico silt loam	6.1	2.4%	155	271	4.3"	14.2"	6.9"	3.2"	0.6"	29.2"

<sup>a</sup> Region average season precipitation (May through September) = 30.2", 10.4" above normal

#### **Crop Management Practices at the Soybean Test Locations – CENTRAL REGION**

Location	Dates		Fertilizer			Tillage	Herbicides		
	Planting	Harvest	N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O		Pre	Post	
Annada	abandoned								
Columbia	June 26	Oct 20	0	0	0	Min.	Dual II Magnum, Sonic, Roundup PowerMax	Select, Flexstar	
Grand Pass	June 12	Oct 20	0	0	0	Notill	Dual II Magnum, Sonic, Roundup PowerMax	Select, Flexstar	
Henrietta	June 4	Oct 19	0	0	0	Min.	Dual II Magnum, Sonic, Roundup PowerMax	none	
Truxton	July 6	Oct 30	0	0	0	Min.	Fierce, Sencor, Liberty	Fusilade

## SOUTHWEST REGION

### CROP MANAGEMENT SUMMARY for 2015

The Soybean Test was conducted at four locations (Adrian, Garden City, Lamar, Urich) in the Southwest Region.

#### **Characteristics of the Soybean Test Locations – SOUTHWEST REGION**

Location	Soil Type	Soil Test					Precipitation				
		pH	OM	P	K	May	June	July	Aug	Sep	Season <sup>a</sup>
Adrian	abandoned										
Garden City	Haig silt loam	4.9	2.6%	65	498	8.7"	4.1"	7.1"	2.7"	3.7"	26.3"
Lamar	Parsons silt loam	6.4	2.4%	46	218	8.5"	7.1"	4.3"	6.6"	1.6"	28.1"
Urich	Hartwell silt loam	4.9	2.8%	35	268	9.2"	7.8"	6.1"	6.3"	2.9"	32.3"

<sup>a</sup> Region average season precipitation (May through September) = 28.7", 5.7" above normal

#### **Crop Management Practices at the Soybean Test Locations – SOUTHWEST REGION**

Location	Dates			Fertilizer			Tillage	Herbicides		
	Planting	Harvest	N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O			Pre	Post	
Adrian	abandoned									
Garden City	June 11	Oct 21	0	0	0	Conv.	Dual II Mangum, Sonic, Roundup PowerMax		Select, Flexstar	
Lamar	June 10	Oct 15	0	0	0	Min.	Dual II Magnum, Sonic, Roundup PowerMax		Select, Ultra Blazer	
Urich	June 11	Oct 21	0	0	0	Min.	Dual II Magnum, Sonic, Roundup PowerMax		none

## SOUTHEAST REGION

### CROP MANAGEMENT SUMMARY for 2015

The Soybean Test was to be conducted at five locations (Chaffee, Morehouse, New Madrid, Portageville loam, Portageville clay) in the Southeast Region. Irrigation was available at all five locations. The Maturity Group 4 test at the Portageville loam and Morehouse locations were abandoned because of poor stands resulting from excessive rainfall. The Portageville clay Maturity Group 5 test was not harvested by press time. If weather permits, we will harvest the experiment and present the data on-line.

#### **Characteristics of the Soybean Test Locations – SOUTHEAST REGION**

Location	Soil Type	Soil Test					Precipitation					Irrigation
		pH	OM	P	K	May	June	July	Aug	Sep	Season <sup>a</sup>	
Chaffee	Commerce silt loam	5.0	1.3%	44	252	5.5"	4.6"	9.8"	3.7"	2.2"	25.8"	0"
Morehouse	Sharkey clay	6.1	2.8%	43	415	5.2"	2.9"	10.1"	3.1"	0.9"	22.2"	4"
New Madrid	Bosket sandy loam	5.6	1.4%	82	355	2.3"	4.2"	5.9"	4.1"	0.4"	16.9"	4"
Portageville Clay	Portageville clay	7.1	4.7%	88	639	5.9"	4.0"	5.1"	2.5"	0.9"	18.4"	8"
Portageville Loam	Tiptonville silt loam	6.5	1.1%	54	275	5.9"	4.0"	5.1"	2.5"	0.9"	18.4"	12"

<sup>a</sup> Region average season precipitation (May through September) = 20.7", 1.6" above normal

#### **Crop Management Practices at the Soybean Test Locations – SOUTHEAST REGION**

Location	Dates		Fertilizer			Tillage	Herbicides	
	Planting	Harvest	N	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O		Pre	Post
Chaffee	June 5	Nov 11	0	63	105	Conv.	Dual II Magnum, Sonic	None
Morehouse	June 12	Nov 14	0	0	0	Conv.	Dual II Magnum, Sonic	None
New Madrid	June 4	Nov 11	0	0	0	Conv.	Dual II Magnum, Sonic	None
Portageville Clay	June 4	Oct 23	0	0	0	Conv.	Dual II Magnum, Sonic	None
Portageville Loam	June 3	Nov 13	0	0	0	Conv.	Dual II Magnum, Sonic	None

<sup>1</sup> MG = maturity group; first digit is maturity group; second digit is relative maturity within the group.

<sup>2</sup> Seed treatments listed in table were applied by seed companies to seed entered into MU Variety Testing Program. Purchased seed may contain other seed treatments. See seed company representatives and seed labels for more information. 1=AcceleronF/I, 2 =Acceleron, 3 = ApronMaxx, 4 = Escalate, 5 = Cruiser, 6 = CruiserMaxx, 7 = Gaucho, 8 = Cruiser Maxx Advanced, 9 = Bonus Coated +, 10 = Maxim, 11 = Metalaxl, 12 = Clariva Complete, 13 = Poncho, 14 = NitroShield, 15 = EverGol, 16 = SmartCote Extra, 17 = Allegience, 18 = Trilex, 19 = Vibrance, 20 = Votivo, 21=ILeVo, 22=Protect D, 23=EverGol Energy, 24=Avicta Complete, 25=imidacloprid, 26=unknown, 27=none.

<sup>3</sup> Phyto = Phytophthora. Information in the "Gene" column identifies the presence of one of several possible genes that provide resistance to specific races of the fungus that causes Phytophthora root rot. Field tol. = field tolerance, a rating for the ability of the variety to perform in the presence of the fungus that causes Phytophthora root rot. Scale 1-9 (1=excellent, 9=poor). "n/i" means the company did not provide information.

<sup>4</sup> Source of resistant to soybean cyst nematode. Peking = PI548402; Hartwig = PI437654. "n/i" means the company did not provide information.

<sup>5</sup> Rating for SDS (sudden death syndrome) resistance. Scale 1-9 (1=excellent, 9=poor). "n/i" means the company did not provide information.

<sup>6</sup> There are several traits that confer herbicide tolerance to soybean varieties. "Y" in the "Gly" column means the variety possesses a glyphosate resistance trait (biotech). "Y" in the "Glu" column means the variety possesses a glufosinate resistance trait (biotech). A "Y" in the STS column means that the variety tolerates higher rates of some sulfonylurea herbicides (non-biotech). "n/i" means the company did not provide information. See seed company representatives for more information and check seed bag for registered trademarks of specific traits of interest.
